Experience

Ford Motor Company — Jul. 2024 – Present
Ford College Graduate Program (Rotational) — *Dearborn, MI*

Software Engineer, Autonomy Analytics – Latitude AI — *Apr. 2026 – Present*
- Automated exports of build-over-build predicted behavior progressions and regressions from a Plotly Dash dashboard into scenario-ordered CSVs via pandas, saving 15+ engineering hours per week
- Identified and resolved a scoring logic defect in an upstream predicted behavior metric affecting hundreds of datasets, correcting silently invalid results that masked true model performance

Software Engineer, OTA Platform — *Jan. 2026 – Apr. 2026*
- Architected an OTA installation time estimation module for Ford's Universal EV platform, exposing predicted update durations and performance metrics consumed by vehicle HMI and fleet management systems
- Implemented structured, filterable logging across Rust-based OTA services, reducing time-to-diagnose for failures and improving reliability in distributed vehicle software update workflows
- Extended OTA CLI with auto-termination logic based on runtime completion conditions, eliminating manual intervention in local and CI test workflows

Software Engineer, DevOps — *Jul. 2025 – Jan. 2026*
- Prototyped API endpoints in Python and FastAPI for an automated software release tool, reducing manual coordination overhead across 5+ internal teams
- Established a unit test build system across 12 legacy controls software features using Ceedling, enabling continuous validation of safety-critical embedded components

Software Engineer, Perception Evaluation — *Jan. 2025 – Jul. 2025*
- Designed a BigQuery-backed metrics infrastructure for an in-house machine learning model, automating metric population via data pipeline integration and visualizing results through Apache Superset dashboards
- Automated data ingestion and indexing for Ford's low-speed autonomy perception evaluation pipeline via a Python API, eliminating manual data handling across 5 sensor modalities
- Evaluated perception features across thousands of datasets, surfacing error cases that replaced ad-hoc reporting workflows and directly informed model retraining decisions

Software Engineer, EV Auxiliary Controls — *Jul. 2024 – Jan. 2025*
- Delivered 7 features ahead of schedule for Ford's first in-house bidirectional charging controls stack, advancing project timelines by up to 3 months
- Resolved 2 requirements gaps and edge cases with systems engineers pre-implementation, preventing downstream defects across Ford's bidirectional V2H charging platform

Ford Motor Company — May 2023 – Aug. 2023
Connected Vehicle Software Intern — *Dearborn, MI*
- Developed ASIL-C rated embedded C software for next-generation EVs using TDD, achieving near-100% test coverage with gcovr and Ceedling
- Led end-to-end lifecycle of a safety-critical software component from ISO 26262 requirement authoring through platform integration

Skills

Languages: Python, C, C++, Rust, SQL (BigQuery)
Technologies: BigQuery, Apache Superset, pandas, NumPy, Matplotlib, pytest, Ceedling, CMock, Docker, Bazel, Git, Gerrit, gcovr, FastAPI

Education

Georgia Institute of Technology
Master of Science in Computer Science — *Expected May 2028*

Virginia Polytechnic Institute and State University
Bachelor of Science in Computer Science, Minors in Cybersecurity, Spanish — *May 2024*
